

Monolith Engine

Module-by-Module Workflow Diagrams

Companion to the System & Project Documentation
Generated from direct source-code and schema analysis - 20 Aug 2026

Accounting

Operational documents (invoices, bills, payments) are validated against tax and period rules, posted through the posting engine into journals and the general ledger, and reflected in financial statements. Periods can be locked once closed.

Customs House Agent (CHA) Operations

The core service line: a CRM enquiry converts into a job, a Drive/Chat workspace is auto-provisioned, documents move through a checklist with an approve/rework loop, filing data is entered against statutory reference data, and expenses/advances feed into billing.

Freight Forwarding

An accepted quote becomes a booking, which produces either a House Bill of Lading (HBL) or Master Bill of Lading (MBL) document before the transaction is processed and finalized.

Customer Relationship Management (CRM)

Leads (manual or auto-imported via Justdial) qualify into deals and quotes; accepted quotes convert into CHA jobs or freight bookings, or become support tickets. A parallel call-center flow captures, transcribes, and reviews customer calls.

Human Resources (HRMS)

From job posting through interview and offer, a hired candidate becomes an employment record, generating HR letters, feeding payroll/salary structure, and enabling travel requests and HR helpdesk cases.

Attendance & Leave Management

Biometric or manual punches sync into attendance records, feeding regularization and overtime. Independently, leave requests are checked against balance and policy, routed through approval steps (or a delegate), and, once approved, posted to the leave ledger with an optional external calendar sync.

Performance & Learning (AMS / LMS)

An appraisal cycle moves from self-assessment through reviewer rating, management review, and hike decision. Separately, published courses are enrolled in, assignments completed, and completion reported.

Communication

Job creation auto-provisions a Google Drive folder and Chat space. Email is sent/received via an integrated Gmail client and can be linked to a job; meetings are scheduled via Google Calendar with an auto-generated Meet link. All activity rolls up into a communication overview dashboard.

Customer Portal

An invited customer activates their portal account, then can view shipment documents and checklists, upload/version documents, respond to checklists, or raise a query thread, all of which notify staff.

Recruitment (ATS + Job-Seeker Portal)

A published opening is discovered by job seekers, who receive AI-assisted job matching and AI-tailored resumes before applying. Applications then move through the internal ATS's stage tracking, interview, and offer process.

Platform Administration

Administrators define roles and permissions, assign them to users, configure organizational structure, manage sessions and passkeys for security enforcement, and edit design tokens that reflect live across the UI theme.

Internal AI Assistant ("Mona")

A user prompt (web or mobile) is attached with RBAC context, passed through a rate limit check, and sent to the Google Gemini API. If quota is available, a response returns and the user's model preference is persisted; otherwise a cooldown applies.

To-Do / Personal Productivity

A task can carry subtasks and an optional reminder. When a reminder is due, a notification fires. Tasks are marked complete, updating an overall progress indicator.

Notifications

Any triggering event across the platform creates a notification record, delivered to the user, who can open, acknowledge, dismiss, or bulk-mark it read.

Expense

An expense entry is either one-time or generated by a recurring schedule, then goes through approval before being posted into Accounting.

Items / Product Catalogue

Items created in the catalogue are referenced by CRM quotes and by accounting invoices/documents, with the catalogue maintained centrally.

People

This module's own test suite asserts a 'coming soon' state, evidence that it is at an early, largely unbuilt stage relative to the rest of the platform.

Incentives

A closed CRM deal or completed sale triggers incentive-rule evaluation, calculation, approval, and recording against the responsible employee.
